PKG-013 · Winter Pack — Cold-Season Readiness for Home, Pipes & Vehicle

Sample pages from: Start Here (Document 01), Pipe Freeze (Document 03), Hypothermia (Document 05), and the 5-Day No-Power Protocol (Document 08) of the Winter Pack.

These are unaltered pages from the actual pack. Every guide in the Winter Pack runs the same way: an action card first, safety boundaries stated up front, the working content, and a printable sheet your household completes by hand — that paperwork is the product.

The pack ships in US Letter and A4 editions of every document.

FULL PACK: SHOP.EOTWSG.COM · 14-DAY NO-QUESTIONS REFUND · HOUSEHOLD LICENSE

Front matter — the pack, the boundaries, and how the pieces fit

PRE-SEASON AUDIT · PIPE FREEZE · VEHICLE KIT · COLD INJURY · ICE STORM & CO · 5-DAY PROTOCOL · SEASONAL CALENDAR

Winter does not test your gear list. It tests whether you did the boring work in October.

This pack is the winter layer of the EOTWSG library: the preparation, discipline, and household paperwork for deep cold, ice storms, and multi-day power outages in the US and Canada. It is not a general survival guide and it does not repeat the packs it stands on. Generation and stored energy live in the Energy & Power Pack (PKG-005). The home's structure lives in Shelter & Infrastructure (PKG-006). Water planning lives in Water & Sanitation (PKG-002). This pack is the operating discipline that keeps all of that safe and working **in the cold** — and the rehearsal for it is Scenario 3 of the Drill Pack (PKG-012). The Drill Pack sells the rehearsal. This pack sells the reference.

It also carries the medical side of cold, within strict layperson limits: Documents 05 and 06 cover recognising hypothermia and frostbite early and giving the first-aid response public guidance supports — and knowing exactly where that response stops and professional care takes over. The boundaries below state that scope before anything else does.

Every guide in this pack follows the same structure, on purpose: an action card first (what to do right now), safety boundaries stated up front, the working content second, and printable sheets your household fills in by hand — because in a real event you will not read essays. You will run cards.

WHAT'S IN THIS PACK

DOC	CONTENTS
01	**Start Here** — this document: what the pack covers, what it deliberately does not, and the safety boundaries that govern every other page.
02	**The Cold Home: Pre-Season Audit.** The autumn walk-through: heating system, fuel, pipe exposure, the one-warm-room plan, stored clothing and bedding. Includes the Cold Audit sheet and the One-Warm-Room Plan card.
03	**Pipe Freeze: Prevention and Response.** Which pipes freeze first, how to keep them from freezing, the drip-versus-drain decision, and the shut-off-first sequence if one bursts. Includes the Shut-Off & Pipe Map.
04	**Vehicle Cold Kit.** The winter layer on your vehicle system: kit by function, freeze-tolerant water and food, fuel discipline, and the stranded-vehicle protocol. Includes the Vehicle Cold Kit Checklist.
05	**Hypothermia: Recognition and Response.** Whole-body cold injury, stage by stage — what changes in behaviour, speech, coordination, and consciousness as it deepens, who is most at risk, and the layperson response: shelter, dry, insulate, warm slowly and core-first, and the 911 decision made early. Includes the Cold Exposure Recognition & Escalation card.
06	**Rewarming & Frostbite.** How warming works and where its dangers sit — core before limbs, afterdrop, why "seems better" is not the end — and frostbite within layperson limits: frostnip vs. frostbite, the warm-water rewarming rules, and the never list.
07	**Ice Storm & Generator CO Rules.** How ice events differ from snow events, shelter-in-place structure, and the carbon monoxide discipline that applies to every fuel-burning

PIPE FREEZE

Prevention, the drip-versus-drain decision, and shut-off first

WHICH PIPES GO FIRST · PREVENTION · COLD-SNAP WATCH · FROZEN VS. BURST · ESCALATION

DO THIS FIRST

Before the season: every adult in the household can walk to the main water shut-off in the dark and operate it, and the Shut-Off & Pipe Map at the end of this document is filled in and filed. During a cold snap: run the watch rotation on the at-risk list. If a pipe bursts: shut off the water first, ask questions second.

SAFETY BOUNDARIES — STATED UP FRONT

NON-NEGOTIABLES

- **Never use a torch, propane heater, or any open flame to thaw a pipe.** Frozen pipes are thawed with gentle, attended heat only — or not thawed by you at all.
- **Never leave applied heat unattended.** Any heat source working on a pipe is watched, the whole time, by an awake adult.
- **Water and electricity stay apart.** No electrical device operates in standing water or where a burst could put it in water. If that condition exists, the answer is the shut-off and a plumber, not a workaround.
- **This document contains no repair procedure.** No cutting, soldering, or replacing pipe; no work on gas lines of any kind; no live work on a wired heat-cable installation. Those are licensed-trade jobs, in every season.

WHY PIPES FREEZE — AND WHICH ONES GO FIRST

Water expands as it freezes. Inside a closed pipe, that expansion has nowhere to go, and the pressure — not the ice itself — is what splits the pipe. The split often happens away from the visible ice, and it does not leak until the ice thaws. That is why a freeze is a water-damage event on a timer, and why this document treats **knowing your shut-off** as the core skill.

Pipes freeze in a predictable order. In sustained cold — the risk climbs sharply once temperatures sit below about –7 °C / 20 °F, and rises with wind and duration — the first to go are:

- Pipes in **exterior walls**, especially on the windward side of the house.
- Pipes in **unheated spaces**: crawlspaces, garages, attics, unfinished basements.
- Pipes to **unused fixtures**: the guest bathroom, the laundry tub nobody runs in winter, the outdoor hose bibb line.
- Any pipe run **far from the home's heat** or near a foundation vent or air leak (Document 02's exposure pass found these).

Your at-risk list from the Cold Audit is the working list. If a pipe is not on it, add it now — the list is the plan.

PREVENTION

In the calm season

- **Insulate the at-risk runs.** Foam pipe sleeves or equivalent insulation on every listed pipe is cheap, permanent, and works while you sleep. This is the single highest-value hour in this document.
- **Heat cable is a topic with fences.** Where insulation alone is not enough, electric heat cable exists — installed and used **exactly** per its manufacturer's instructions and your local electrical code, on

HYPOTHERMIA

Cold injury I — recognising whole-body cold, stage by stage, and the layperson response

RECOGNITION BY STAGE · RISK FACTORS · FIELD RESPONSE · THE 911 DECISION · ESCALATION CARD

DO THIS FIRST

Someone in your household is colder than the weather explains and it is not turning around: out of the cold and wind, off the cold ground, wet clothing off, dry insulation on — head covered. Confusion, slurred speech, clumsiness, or shivering that stops is a 911 call, made now, while you warm them. Cold injury deepens quietly. Early is the whole game.

THIS DOCUMENT'S BOUNDARIES — READ FIRST

This document is **first aid, not medical training**. It follows the public first-aid guidance of the US Centers for Disease Control and Prevention (CDC) and the American Red Cross, at layperson scope: recognise, protect from further cold, warm slowly and gently, and escalate to professional care. It teaches no diagnosis and no treatment beyond that scope, and it is not a substitute for training or professional care — the same limit the Medical & CBRN Pack (PKG-004) states about itself. Anyone showing Stage 2 or Stage 3 signs below is an emergency-services call. When in doubt, call: dispatchers would rather talk you through a false alarm than meet you at a worse one.

WHAT HYPOTHERMIA IS

Hypothermia is whole-body cold injury: the body loses heat faster than it can make it, and its core temperature falls. It is not only an arctic problem. Wet clothing plus wind, exhaustion, inadequate clothing for the actual wind chill, or immersion in cold water can produce it in temperatures well above freezing — which is why it belongs in a pack about ordinary houses in ordinary winters, not only in expedition manuals. The person it takes is usually the person nobody was watching: cold injury impairs the judgment of the person it is happening to, early. Recognition is a watcher's job. That is why this document is organised by what **you** can see.

RECOGNITION — THREE STAGES

This is a recognition framework, not a diagnosis. People do not descend in tidy steps, and you will rarely see a textbook stage — watch the **direction of travel**. Any move down this table is action, and the stage boundaries are where the 911 decision lives.

STAGE	WHAT YOU SEE
1 — COMPENSATING	**Shivering.** Cold, pale skin. Numb, clumsy hands — buttons, zippers, and bootlaces get hard. Still alert: talking, thinking, and cooperating normally, and they know they are cold and say so. Caught here, this is usually a warm-room problem — handled with the response below and close watching.
2 — DEEPENING	**Shivering hard — then starting to ease off. The easing is worsening, not recovery.** Slurred speech. Stumbling, fumbling, dropping things. Apathy and impaired judgment: confused, indifferent, making poor decisions, may insist "I'm fine" and resist help. Coordination is failing. **This stage is a 911 call.**
3 — SEVERE	**Shivering has stopped.** Drowsy, glassy-eyed, drifting toward unconsciousness or fully unresponsive. Breathing and pulse slow, weak, and hard to find. This person

PRINTABLE — DAY 1 PLANNER · SECURE & CONSOLIDATE

DATE: _____ **EVENT / OUTAGE CAUSE:** _____

FIRST 60 MINUTES

- ☐ Secure — everyone accounted for · travellers contacted
- ☐ Mitigate — warm room in effect · pipe watch started · drip/drain decision made
- ☐ Communicate — contact tree activated · check-in schedule set
- ☐ Illuminate — lighting kit in warm room · CO rules in force
- ☐ Capture water — containers filled

THE HONEST COUNT

STORED WATER (LITRES / GALLONS): _____
FUEL (TYPE / AMOUNT / EST. DAYS AT PLANNED BURN): _____
FOOD (DAYS, STATED PLAINLY): _____
DECISIONS MADE TODAY: _____
